

MEASUREMENT OF ASSEMBLED HOSES

Positioning angle between fittings

For assembled hoses with both fittings type elbow 45 degree, 90 degree and banjo fittings, it's necessary to state the relative angle between them, this means the orientation to be established as shown in the figure. Keep the hose in a horizontal position then, starting from the eye of the observer, place the furthest fitting in a vertical position and measure the angle between the nearest fitting and the vertical of the opposite one in a clockwise direction. In conformity with ISO 1436 - ISO 17165-1.

Permitted tolerance +/- 3 degrees
